

### *Hey Haulers!*

Don't overfill your trucks and slosh whatever you are hauling all over the ground or roads.

Little spills are a big deal and need to be addressed accordingly. Take care to not drip, dribble, or drop whatever is in your tank. The pollution that occurs when this happens is called non-point source pollution and is one of the major causes of dead zones in our rivers, bays, and oceans.

## How you can help

- Don't take that turn so fast!
- Fill up, but allow some room for water or whatever you are trucking to move inside your tank
- If you notice a leak or some spill let someone know, don't just ignore the problem because it won't go away
- Take charge and spread the word
- Every small step counts toward the greater good
- If there is a major problem call 911 so they can send the appropriate clean-up crew
